EXPORT COMPLIANCE / ENCRYPTION USE DECLARATION

App: Eigen Pocket
Bundle ID: com.eigenvertex.recorder
Developer: Gabriel Jevardat de Fombelle, EigenVertex
Apple ID: 6816011743
Date: 24 October 2026

This document describes the use of encryption within the Eigen Pocket iOS application, in support of the App Encryption Documentation requirement for distribution on the App Store, including in France.

1. SUMMARY OF ENCRYPTION USE

Eigen Pocket uses encryption solely to protect data in transit between the application and the EigenVertex backend over the public internet. This is implemented exclusively through TLS (HTTPS), using Apple's standard networking APIs (URLSession / the iOS Network framework) and the encryption built into the iOS operating system. The app also stores authentication tokens using the iOS Keychain, whose encryption is implemented and managed entirely by the operating system.

2. WHAT THE APP DOES NOT DO

- The app does not implement, embed, or distribute any proprietary or non-standard cryptographic algorithm.
- The app does not implement any cryptographic primitive itself; it relies exclusively on the standard, publicly available TLS implementation provided by the iOS operating system.
- The app does not use encryption to protect the confidentiality of locally stored user content (audio recordings and notes are stored unencrypted in the app's local sandboxed storage, protected only by standard iOS file-system and app-sandbox protections).
- The app contains no encryption functionality beyond what is required to establish a standard HTTPS connection.

3. CLASSIFICATION

The only cryptographic functionality in Eigen Pocket is the use of standard, publicly available encryption algorithms (TLS/HTTPS) for securing data in transit, as provided by the operating system. This qualifies for the "mass market" / standard encryption exemption described in Category 5, Part 2 of the EAR (15 CFR 740.17(b)(1)), and corresponds to the equivalent exemption for the declaration of encryption-using products under French regulations (Article 30 of Law No. 2004-575, implemented via Decree No. 2007-663), as the app uses only standard, off-the-shelf encryption for communication security and performs no cryptographic operations of its own.
